 Direct Submission
Submitted (13-SEP-199) Drosophila Genome Center, Lawrence Berkeley
Laboratory, MS 64-121, Berkeley, CA 94720, USA
On Apr 21, 2001 this sequence version replaced gi:7264762.
Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory, MS 64-121
Berkeley, CA 94720
 This sequence was assembled using end sequences from a whole genome shotgun and from subclones of this BAC and its neighboring clones. For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu.

Submitted (08-JUL-1999) Sanger Centre, Hinxton, Cambridgeshire, Cublo 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk clonerequest@sanger.ac.uk clonerequest@sanger.ac.uk
On Jul 6, 1999 this sequence version replaced gi:5262828.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlapp as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
 Em., EMBL, Sw.; SWISSPROT; Tr., TREMBL
This sequence is the entire insert of clone 278M12. This sequence
as been finished according to sequence map criteria as follows. An
attempt is made to resolve all sequencing problems, such as
compressions and repeats, but not necessarily within known
 This sequence was generated from part of bacterial clone contigs of
 PRI 23-NOV-1999
 human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
 http://www.sanger.ac.uk/HgD/Chr6
278N12 is from the library RPC11 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong. For further
details see http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.

 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 74 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
Worley, K.C.
Direct Submission

Submitted (19-0CT-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

on Dec 20, 2001 this sequence version replaced gi:17064342.
 Consensus quality: 118791 bases at least Q40 Consensus quality: 127201 bases at least Q30 Consensus quality: 132476 bases at least Q30 Estimated insert size: 94009; sum-of-contigs estimation Quality coverage: 0x in Q20 bases; agazose-fp estimation Quality coverage: 1.3x in Q20 bases; sum-of-contigs estimation

 * NOTE: This record contains 1 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* Will be sequenced to completion. In the event that

* the record is updated, the accession number will
 622 IGCCCGCGACAACAAGAAATCIAGGAICAICCCACGCCACCIICAACIC.

New BASB120 polypeptides and polynucleotides from Moraxella catarrhalis strain American Type Culture Collection 43617, for use as therapeutic agents or vaccines against bacterial infections, e.g. otitis media or pneumonia

Claim 13; Page 64; 75pp; English.

The invention relates to the Moraxella catarrhalis strain ATCC43617

BASB120 protein (AAB60645) and to DNA encoding it (AAF59797). The
invention also relates to immunogenic fragments of the BASB120 protein,
expression vectors and host cells comprising BASB120 nucleic acids, the
recombinant production of BASB120, vaccine compositions comprising the
BASB120 protein or nucleic acid, an antibody against BASB120, therapeutic
compositions comprising the anti-BASB120 and amethod of
identifying a Moraxella catarrhalis infection via the detection of
BASB120 proteins or antibodies. The vaccine compositions of the invention
compositions as prophylactic or therapeutic agents against Moraxella
are useful as prophylactic or therapeutic agents against Moraxella
catarrhalis infections in mammals, particularly humans. Moraxella
catarrhalis is a Gram negative bacterium frequently isolated from the
human upper respiratory tract, which is responsible for several
catarrhalis an orditions. It is responsible for about 15% of otitis media
cases in children (which can lead to temporary or permanent hearing
loss). It also causes pneumonia in elderly people, and sinusitis,
cases in children (which may lead to temporary or permanent hearing
loss). It also causes pneumonia in elderly people, and sinusitis,
cases in children (which may additionally be used in screening for novel
can bacterial compounds, and in the diagnosis and staging of infections.
The present sequence represents DNA encoding the Moraxella catarrhalis

The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAR78814-AAR28854). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as ottiss media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis

and meningitis.

Genomic library for identifying diagnostic and therapeutic compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and insectle. The development of in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and contraining a peripheral neuropathy and system, such as a localised neuropathies and central nervous system diseases, such as lateral sclerosis, and shy Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and constructions.
 The sequence data for this patent did not form part of the printed

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition

prepared from various human tissues, for diagnosis and treatment of cancer, neurological, inflammatory, and autoimmune disorders

Novel polypeptides and nucleic acids obtained from cDNA libraries

ischaemla-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth prophylaxis or (i), (I) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease,

Parkinson's disease, Huntington's disease, and amyotrophic lateral solutions. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopolesis and is useful for treating myeloid or 1 ymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, classics, or treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for reperfusion injury in various tissues, various immune defloiencies and disorders including severe combined immunodeficiency (SCID), bacterial or rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorhythms or circadian cycles of rhythms, fortallity, metabolism, catabolism, anabolism, storage or elimination of distance of effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in avecine composition to raise an ordine seminance of the invention coding sequences of the invention.

the invention provides a method for introducing and expressing heterologous RNA in bone marrow cells using alphavirus vectors. The clindwood S.A.virus is an alphavirus whose cDNA sequence was determined cirdwood S.A.virus serverse transcriptase-PCR reaction fragments amplified from uncloned reverse transcriptase-PCR reaction fragments amplified from the virion RNA. The Girdwood S.A.virus CDNA encodes nonstructural and structural polyproteins. The nonstructural polyprotein is, presumably, post-translationally modified into five different protein products, namely nspl (AAW70475), nspl (AAW70473), nspl (AAW70475), nspl (AAW70475), nspl (AAW70475), nspl (AAW70475), nspl (AAW70475), nspl (AAW70475), proteins. The Girdwood S.A.virus CDNA was used in the method of the invention. The inventors claim the transformed bone marrow cells are useful for expressing a protein or peptide suitable for protecting the subject against a disease such as a microbial, bacterial, protozoal, parasitic or viral disease. The transformed bone marrow cells are also claimed to be useful for expressing proteins and peptides such as
 Expression of heterologous RNA in bone marrow cells – using a recombinant alphavirus comprising a promoter operable in bone marrow cells operably associated with heterologous RNA.

The present sequence is that of DNA encoding PltM (see AABB2510), a regiospecific pyoluteorin halogenase of Pseudomonas fluorescens. The enzyme can be used for the biosynthesis of halogenated natural products, where the halogenation is substrate and regiospecific. A regiospecific manner comprises contacting the substrate in a regiospecific hanner comprises contacting the substrate with a regiospecific halogenase (see AABB2506-13) in the presence of an and a reductant. A host cell that expresses at least 1 endogenous and a reductant. A host cell that expresses at least 1 endogenous regiospecific halogenase and which also includes a heterologous regiospecific halogenase and which also includes a heterologous regiospecific halogenase and which also includes a heterologous protection of host organisms against pathogens. For example, crop protection of host organisms against pathogens. For example, crop protection of host organisms against pathogens and transgenic plants can be protected against fungal disease by expression of provincinitrin from a host cell. Transgenic plants and transgenic are provided. Plants with enhanced resistance to phytopathogens and biological control organisms with enhanced activity can be
 Transferring a halogen to a substrate in a regiospecific manner for the production of pyrrolnitrin for plant protection comprises contacting the substrate with a regiospecific halogenase and an electron

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and call-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 present of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequences AAS3541-AAS36942 represent genomic DNA molecules, which encode cardiovascular system antigen polypeptides of the invention. Cardiovascular system antigens and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, colickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in a cardiovascular system antigen polynucleotide. The treatable disorders include autoimmune system antigen polynucleotide. The treatable disorders such as neoplasms of the breast or liver, cardiovascular disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, viruses and fungi, coular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, by bacteria, viruses and fungi, coular disorders such as conneal infection, endocrine disorders such as Crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as asthma and pleurisy. The polypeptides can also be used to aid wound healing, to cransplantation, to regenerate tissues and in chemotrasis.

Or prevent skin ading due to sunburn, to maintain organs before transplantation, but was obtained in electronic format directly from WIPO at the printed sy the printed in the printed in the printed cardiac artical parts and parts of the printed sy at the printed cardiac artical parts and parts of the printed cardiac parts are parts of the parts o
 New cardiovascular system related polynucleotides and polypeptides, useful for diagnosing, treating and/or preventing disorders of the cardiovascular system -

Sequences mass) 14. Table set to purch the man micro encourable disposated antiqen antiqen polypeptides of the invention.

Cardiovascular system antiqens and their associated polymention.

Cardiovascular system antiqens and their associated polymencleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in a cardiovascular system antigen polymencleotide. The treatable disorders include autoimmune system antigen polymencied. The treatable disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cerebral ischaemia, nervous system disorders such as Alzheimer's disease, infections caused by bacteria, viruses and fungl, ocular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, gastrointestinal disorders such as Crohn's disease, renal disorders such as premature labour and infertility, correvent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in chemotraxis.

Cransplantation, to regenerate tissues and in chemotraxis.

Cransplantation, but was obtained in electronic format directly from WIPO cat fitp.wipo.int/pub/published_pct_sequences.

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM; Rosen CA, Barash SC,

WPI; 2001-451930/48.

New cardiovascular system related polynucleotides and polypeptides, useful for diagnosing, treating and/or preventing disorders of the cardiovascular system -

Claim 1; SEQ ID No 1259; 674pp; English.

Sequences AAS35741-AAS36942 represent genomic DNA molecules, which encode the cardiovascular system antigen polypeptides of the invention.

Cardiovascular system antigens and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, cc fickens or sheep. A pathological condition can be determined by cheeting the presence or absence of a mutation in a cardiovascular of seases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiovascular disorders such as cardiovascular disorders such as cardiovascular disorders such as corneal ischaemia, or viruses and fungi, ocular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, as glomerulonephritis and respiratory disorders such as asthma and plection, endocrine disorders such as Crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as asthma and pleurisy. The polypeptides can also be used to aid wound healing, to transplantation, to regenerate tissues and in chemotaxis.

Contant plantation, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published\_pct\_sequences.

WO200157182-A2.

```
AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM62170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
that affect the activity of (I) by expressing inactive proteins or to
expension by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
cyplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
concers and creat immune/haematopoietic-derived cells. AAK64703
concers and cancer metastases of haematopoietic-derived cells. AAK64703
concers and cancer metastases of haematopoietic antigen genomic
sequences from the present invention. AAK54950 and AAM82169
concers and concer metastases.
 Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and

The present sequence is a cDNA encoding mouse tumour necrosis factor receptor/osteoprotegarin (TNFT/OPG)-like protein. TNFT/OPG-like protein is useful for the treatment, prevention or amelioration of a medical condition in a mammal resulting from decreased levels of TNFT/OPG protein. Nucleic acid sequences of the present invention are used to map locations of the TNFT/OPG genes and related genes. They are also used as antisense inhibitors of TNFT/OPG expression. TNFT/OPG-like protein and cDNA sequences are also used in gene therapy.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to novel isolated prostate gland related nucleic acids (I) and polypeptides (II). (I) and (II) are useful for diagnosis, prognosis, prevention, and/or treatment of diseases and/or disorders of the prostate such as acute non-bacterial prostatitis, chronic non-bacterial prostatitis, chronic non-prostatosis, granulomatous prostatitis, malacoplakia, benign prostatic prostations, and prostate neoplastic disorders, including adenocarcinomas, transitional cell carcinomas, ductal carcinomas, and squamous cell carcinomas. (I), (II) and antibody to (II) are useful for diagnosing and treating reproductive system disorders (Paget's disease), authorimune disorders (systemic lupus erythematosus, rheumatoid arthritis), blood related disorders (sickle cell anaemia), hyperproliferative disorders, urinary system disorders
 Novel isolated prostate gland related polypeptide useful for diagnosis and treatment of disorders of prostate such as prostatodystonia, prostatosis, prostatitis, benign prostatic hypertrophy and malacoplakia

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition .

The invention relates to isolated polynucleotide (I) and proposed polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (C or identifying expressed genes, (I) is useful in gene therapy techniques (I). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity emito acid sequences. Aasofuls-rand products dependent on DNA and diagnostic coding sequences of the invention.

C monic or acid sequences of the invention.

C Note: The sequence data for this patent did not appear in the printed sequences. Account of the printed of specification, but was obtained in electronic format directly from WIPO at the code of the code of the control of the printed of the code of the cod
 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The present invention describes a purified or isolated nucleic acid
sequence (I) consisting essentially of one of the 93 nucleotide sequences
given in AAHB1294, where expression of the nucleic acid in a
microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in

(I) have antibacterial and antibiotic activities, and can be used in

(I) have antibacterial and antibiotic activities, and can be used in

growth and proliferation related proteins given in AAG99078 and AAG98830

c to AAG98999. (I) can be used as potential targets for the generation of
new antimicrobial agents, and for identification of compounds which
interact with the gene products of (I). In addition the expression of
used to generate reagents and screen small molecule libraries or other
candidate compound libraries for compounds that can be further developed
complementary to (I) that are specific for particular species of
mocrogranisms can be used to identify particular microorganism species
in clinical specimens, therefore, providing a rapid and dependable
method by which to identify the causative agents of a bacterial
infection. Also, antibodies generated against proteins translated from
complementary in many proliferation-required sequences can also be used
to screen for specific microorganisms that produce such proteins in a
species-specific manner. AAM8431 and AAM84670 represent sequencing
c related sequence, which are used in an example from the present

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags to identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical

 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-ocal interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulaters. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in subject suffering from an infection. AAs46232-AAs46278 represent Escherichia coli NIMR coding sequences of the invention.
 mar regulated polypeptide; NIMR; microbial infection; antibacterial; ds.

```
The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Paget's disease, Sclerostosis, osteomalacia and fibrous dysplasia. ABA82038 to AMA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention.
 New high bone mass (HBM) and Zmax1 genes and proteins useful for modulating bone mass for the treatment of \varepsilon.g. osteoporosis \cdot

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nuclocide sequences of 5' and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full method. The primers enable the production of the full engres enable the production of the full length cDNA exists without any special methods. The present sequence is a full length cDNA easily human cDNA of the invention.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
 830 Primers useful for synthesizing full length cDNA clones and their

AMES 4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cativity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention. (I) example, they may be used to treat disorders associated with decreased cample, they may be used to treat disorders associated with decreased that affect the activity of (I) by expression in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) colynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the coldagnose and freat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 35437; 3071pp + Sequence Listing; English.

anino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic acitivity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.

Sequence 5866 BP; 1464 A; 1580 C; 1489 G; 1333 T; 0 other;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences.
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 This cDNA clone, deposited as NRRL B-21610, codes for human liver ribonuclease inhibitor (RI) (see AAW48636), a protein useful for the in vitro production of nucleic acids and polypeptides. It was not solated from a human liver cDNA library by PCR amplification (see AAV18088-89). A vector comprising the human RI nucleic acid, a host cell comprising the vector and a method for producing porcine RI by culturing the host cells are claimed. RNase-free recombinant RI is obtained by culturing the host cells and mixing the RI with a chinding partner. Pig liver, rat liver, human liver and chimeric pig-liver RIs (see AAW48627-28 and AAW48636-37) are claimed. The human confined to and chimeric RI can be used in a claimed method for producing nucleic acids (including single-stranded or double-stranded DNA, CDNA, RNA and DNA-RNA hybrids), while pig liver, rat liver, human confined to the fin

Pigment epithelium-derived factor (PEDF) has both neuronotrophic and gliastatic activity, making it useful in cases where neurons die gliastatic activity, making it useful in cases where neurons die quickly and gliat tend to proliferate (gliosis). e.g. in CNS cell culture, in neurodegenerative diseases and in CNS injury. The neuronotrophic effect of PEDF is especially useful for enhancing survival of neuronal cell cultures intended for use in transplantation. These include cultures of human foetal brain cells and neural retina and photoreceptor cells. The gliastatic activity of PEDF can be applied to inhibiting glial cell proliferation in certain tumours. Antibodies directed against PEDF can be used for inhibiting PEDF activity or in an immunoassay for determining ceverain theory. Certain cellular or tissue samples e.g for determining ageing and/or other degenerative diseases.
 Use of pigment epithelium derived factor - for enhancing neuronal cell survival and inhibiting glial cell proliferation, useful, e.g. in CNS cell culture or to treat neuro-degenerative diseases

```
within a tissue by inhibiting endothelial cell migration. The method involves providing exogenous SLED (an antiangiogenic protein) to conditions. The method is useful for inhibiting angiogenesis within a tissue conditions. The method is useful for inhibiting angiogenesis within a tissue preferably of eye, skin, tumour, a tissue under suitable conditions. The method is useful for inhibiting angiogenesis within a joint, or ovarian or endometrial tissue, and especially for inhibiting the growth of a tumor. The method is particularly useful therefore for treating eye injury, hypoxia, infection, surgery, laser surgery, diabetes, retinoblastoma and preventing blindness or retarding loss of vision associated with a variety of eye diseases, disorders of skin such as psoriasis, scleroderma, tumors of skin, neovascularization as a result of infection (e.g. cat scratch disease and bacterial ulceration) or other skin disorders, tumours e.g. tumours that are difficult to operate on such as brain or prostate tumours, disorders of blood vessels such as heamangiomas and capillary proliferation within atherosclerotic plaques, muscles, disorders associated with angiogenesis within a monother disorders associated with angiogenesis within a monother man and wound granularisation.
 Note: The present sequence is not described further in the specification.
 The present invention relates to a method of inhibiting angiogenesis
providing exogenous antiangiogenic protein, SLED to the cells

```
The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, wocobacterium therculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37Rv (AA199682). The method is useful for evaluating strain of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic

91US-0706872 91US-0706872. (HARD ) HARVARD COLLEGE. WPI; 1993-272184/34. Fischbach GD; 29-MAY-1991; 29-MAY-1991;

DNA encoding protein which co-purifies with acetyl:choline receptor-inducing activity - used to obtain prods. for treating deficiencies in neural transmitter receptors, e.g. Alzheimer's

Claim 2; Figure 2; 17pp; English.

ARIA promotes the synthesis and accumulation of acetylcholine receptors (AChRs) in muscle cells. The protein was isolated on the basis of its ability to increase the rate of insertion of AChRs into the surface membrane of chick myotubes. Oligos with sequences corresp. to the sequence of the protein were used to amplify from chicken brain cDNA a 34-nucleotide sequence encoding II AAS from ARIA. The 34-nucleotide sequence corresp. to the 3' nucleotides of the 7th AA codon through the 3' nucleotide of the 18th AA codon. C Each primer contd. an EcoRI site at its 5' end. The first pair of oligos are hacked pairs. The scond pair are AAQ46884/Q46885. The coligos are nested pairs. The second pair are AAQ46884/Q46885. The coligos are nested pairs. The pCR amplified prod. was used as a probe to screen an EI8 chick brain cDNA library. AAQ46887 is the insert from a positive clone obtd. by the screening an EI8 chick brain cDNA library in lambda gill and introduced into a

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114)gb|RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

GSS; GSS (genome survey sequence).
Pan troglodytes male lymphoblast DNA, clone_lib:PTB Chimpanzee Male
BAC Library clone:PTB-155D18.F.
 Direct Submission.

Submitted (02-AUG-2001) Asao Fujiyama, The Institute of Physical and Chemical Research (RIKEN), Genomic Sciences Center (GSC);

1-7-22 Suehiro-chou, Tsurumi-ku, Vokohama, Kanagawa 230-0045, Japan (E-mail:chimpbes@sc.riken.go.jp, URL:http://hgp.gsc.riken.go.jp/, Tel:81-45-503-9111, Fax:81-45-503-9170)

Clones are derived from the chimpanzee BAC library PTB This BAC end was generated during the R&D process and may have higher chance of clone tracking errors.

 Anot; This library was constructed by John Davies and Jeffrey McDermott. RNA was isolated from strain CC-2290 (Minnesota isolate of C. reinhardtil) grown to mid-log phase in TAP (acetate containing) medium in the light. PolyA mRNA was purified, and cDNA was synthesized and directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. pBluescript II SK-plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Anote-"Vector: pBluescript II SK-; Site_I: ECORI; Site_2: Ahof; This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAPP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. POLYA MRNA was purified from each sample, pooled and CDNA Synthesized. The CDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhOI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Anote="Vector: pBluescript II SK-; Site_I: ECORI; Site_2:
XhOI; This library, constructed by John Davies and Jeffrey
McDermott, combines cDNAs from CC-1690 cells grown to
mid-log phase in TAPP (acetate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
PolyA mRNA was purified from each sample, pooled and CDNA
synthesized. The cDNA was directionally cloned into lambda
ZAP II (Stratagene) in the ECORI (5') and XhOI (3') sites,
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with Exhssist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."

 CNSO1Y2Y 886 bp DNA linear GSS 12-MAY-2000 Tetraodon nigroviridis genome survey sequence T7 end of clone 217L13 of library G from Tetraodon nigroviridis, genomic survey
 Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at
http://www.genoscope.cns.fr/Tetraodon.
 Tetraodon nigroviridis

Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Actinopterygii; Neopterygii; Teleostei; Buteleostei; Neoteleostei;
Acanthomorpha; Acanthopterygii; Percomorpha; Tetraodontiformes;
Tetraodontidae; Tetraodon.

```
The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see ARY28314-ARP28534. The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as obttis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
 Genomic library; bacteria; human upper airway; otitis media; sinusitis;
bronchopulmonary; endocarditis; meningitis; ss.
 compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or eptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-SEP-2000;
The invention relates to an isolated polypeptide comprising an amino acid sequence at least 90% identical to 188 amino acid sequences fully defined in the specification and encoded by 188 cDNA clones fully defined in the specification. The invention also relates to a fragment having biological activity, a domain, an epitope, full length protein, variant, allelic variant or a species homologue of the fully defined sequence. The polynucleotide and polypeptide are useful for treating, preventing and/or prognosing disorders related to the pancreas including pancreatic cancer, pancreatitis, diabetes, endocrine disorders such as acromegaly or hyperthyroidism, and gastrointestinal disorders such as croph's disease and duodenal ulcers. The present sequence is a pancreatic cancer-related polynucleotide of the invention.
                                                                                                                                                         Isolated pancreatic cancer polypeptide for treating, preventing and/or prognosing disorders related to the pancreas including pancreatic cancers and also for testing and detection e.g. diagnosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; digestive system antigen; gene therapy; cancer; appendicitis; ulcerative colitis; infection; Hirschsprung's disease; chronic colitis; digestive system disorder; Meckel's diverticulum; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The 5' end of the coding strand overhangs the 3' end of the complementary strand by 4 bases; the 5' end of the complementary strand overhangs the 3' end of the senses strand by AGCT. The sequence encoding streptckinase was first divided into 52 oligonucleotide fragments of 43-56 bases each. The individual fragments were synthesised by solid-phase beta-cyanomethy! phosphate groups added and the fragments ligated to obtain pSKK. This was inserted into expression vector

The present invention relates to multivalent recombinant raccoon poxviruses (RCNV), containing more than one exogenous gene inserted into either the thymidine kinase (TK) gene, the haemagglutinin (HA) gene, or a combination thereof. The multivalent recombinant raccoon poxviruses are useful as vaccines to immunise felines against subsequent challenge by feline pathogens. The recombinant multivalent vaccine is formed by inserting multiple genes such as a feline panleukopenia virus (FPV) gene, and/or a feline calcivirus (FCV) capsid protein gene each operably linked to a promoter, into a raccoon poxvirus for expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Raccoon poxvirus; RCNV; thymidine kinase; TK; vaccine; haemagglutinin;

full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence the oligonucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence, sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
The present sequence is Feline calcivirus (FCV) capsid protein encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length convertions. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs assily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13612 represent human anno acid sequences; and AAH13629 to AAH13632 represent human anno acid sequences; and AAH13629 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13632 represent coligonal and anno acid sequences; and AAH13632 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13632 represent human anno acid sequences; and AAH13632 to AAH13633 represent human anno acid sequences; and AAH13632 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences; and AAH13633 to AAH13633 represent human anno acid sequences acid anno acid sequences acid acid acid acid acid acid acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CRFK cells were inoculated, total poly-A+ RNA was isolated and FCV double-stranded RNA was LiCl fractionated from this RNA. Double-stranded cDNA was prepared , blunt-ended with t4 DNA polymerase and treated with EcoRI methylase prior to ligation of EcoRI linkers. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              feline calcivirus capsid protein; FCV; multivalent vaccine; cat; ds.

Fragments of chemically modified genes associated with tumour suppressor genes and oncogenes, useful in designing primare and probable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; tumour suppressor gene; oncogene; antitumour; cytostatic;
cancer; tumour; CpG dinucleotide; single-nucleotide polymorphism; SNP;
             strains transformed with the viral vectors were plated and positive plaques were transferred to nitrocellulose. They were probed with random-primed cDNA prepared from FCV genomic RNA. A plaque with a strong hybridisation signal was isolated and found to contain an EcoRI fragment (ca.4200bp). It was cloned in pUC18 to give pcV2. A second library was constructed in pUC18 using PstI linkers. A plasmid was selected from this library and designated pcV7. It was plasmid were used to isolate other regions of the FCV genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAS46451
 mixture was digested with EcoRI and ligated to lambda qt10. E.coli

Claim 1; SEQ ID NO 7651; 21pp + Sequence Listing; English.

```
concogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences complementary to (53). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an array for analysing diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the cifferences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the are disadvantageous to patients. The present sequence is one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001B.DAT:ABL18726

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the complete genome of Chlamydia trachomatis. Open reading frames (ORFs) of the genome encode polypeptides AAY36754-Y37949. The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences (ABLO1840-ABL16175) and the encoded proteins (AABL737-ABB2072).
(AABS737-ABS12072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perhepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

proteins, cytochromes, kinesins, cytokines, interferons, interleukins, of protein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the pertides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus errythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic

(SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe #12833 for gene expression analysis in human cervical cell sample.
measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe; human; microarray; gene expression; cervical epithelial cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAI22900

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM

WPI; 2001-541565/60.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases -

Disclosure; SEQ ID NO 11144; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune tharmonytic anaemia, autoimmune thyroiditis; diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from cotal human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

human secreted proteins, and encode the proteins given in AAX12681 to human secreted proteins, and encode the proteins given in AAX12681 to AAX12913, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proteins obtained may have cytokine activity, heam topolesis regulating activity, tissue growth regulating activity, heam topolesis regulating activity, hemotactic/ chemokinetic activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                       forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytckine activity; cell proliferation; differentiation; haematopolesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition; ds.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colypeptide (II) sequences. (I) is useful as hybridisation probes, and for chromosome and gene mapping, and in recombinant production of (II). The colympiant are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to the treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or guantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations colored sequences has assess biodiversity amino acid sequences. AASGALFA represent novel human has and harmortion continuous acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA ilbraries. Such ESTs are not well suited for isolating CDNA sequences have been obtained, the full 5' UTR is rarely included. CDNA sequences have been obtained, the full 5' UTR is rarely included. CS' ESTs are derived from mRNAs with intext 5' ends and can therefore be consect to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence date for this patent did not form part of the parinted specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention provides a number of single exon nucleic acid

Example 4; SEQ ID NO: 21667; 650pp + Sequence Listing; English.

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAK47841

```
The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAL12381

The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001A.DAT:AAL21257

(AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynocleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                          The invention relates to human breast cancer expressed polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human immune/haematopoietic antigen genomic sequence SEQ ID NO:19814

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM; Rosen CA, Barash SC,

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 19814; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to

supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54921 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides encoding human secreted proteins - derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA1999.DAT:AAV89764

nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for encode proteins. They are useful for encode proteins. They are useful for gene discovery, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                 seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001A.DAT:ABA50979
activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for measuring gene expression in sample derived from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New spatially-addressable set of single exon nucleic acid probes, useful for measuring appearance.

determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; foetal liver; gene expression; single exon nucleic acid probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:ABA68959

measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human

SSSXS

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2001A.DAT:AAK17286

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.

The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                         Probe #13775 for gene expression analysis in human cervical cell sample.

```

```
The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                          Probe #17840 used to measure gene expression in human placenta sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases
                                                                                                                                                                       Probe; human; breast disease; breast cancer; development disorder; ss; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel single exon nucleic acid probe used to measuring gene expression in a human breast -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.
                                                                                                             Probe #9440 used to measure gene expression in human breast sample.

The invention relates to novel isolated lung small cell cancer antigen polynucleotides (I) and polypeptides (II) used in a method of detecting cancer in a patient. The method is optionally performed by utilising oligonucleotides (III), where the biological sample cancer in a patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient. (I), (II) or antigen-presenting cells expressing (II) is useful for stimulating and/or expanding T cells specific for a tumour protein. The method comprises contacting T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for stimulating and or inhibiting the development of a cancer especially lung cancer in a patient. An exclopment of a cancer especially lung cancer in a patient. An inhibiting the development of cancer in a patient and for inhibiting the development of cancer in a patient. Ansated cancer in a patient and for inhibiting the development of cancer in a patient and for inhibiting the development of cancer in a patient. Ansated cancer in a patient cancer in a patient cancer in a patient. Ansated cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a patient cancer in a

Streptococcus salivarius sequence used to design primers and probes.
  K K X D X D X C
                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune chaemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycoardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                                                Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA1998.DAT:AAV37035
                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 593; 1701pp + Sequence Listing; English.

```
The present sequence was used to design primers and probes which are used in the course of the invention. The specification describes the use of probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and amount of nucleic acids from a bacterial antibiotic resistance gone and specific bacterial and from a pacterial antibiotic resistance gone and specific bacterial and comprises a selected target region hybridisable with the probes or primers. The method of use comprises contacting the sample with the probes or primers and detecting the presence of hybridised probes or amplified products as an indication of the presence of the specific bacterial or fungal species and bacterial antibiotic resistance genes.

The methods and products can be used to detect and identify the bacterial resistance to antibiotic species and determine the bacterial resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Species specific; genus specific; family specific; probe; detection; identification; algal; archaeal; bacterial; fungal; parasitical;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001A.DAT:AAH01713
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of oligo:nucleotide primers and probes - for detection, identification and quantification of bacteria, fungi and bacterial antibiotic resistance gene(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus salivarius nucleotide sequence SEQ ID NO:1706.
Detection; bacterial antibiotic resistance gene; bacteria; fungal species; identification; ds.

Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

Disclosure; Page 1288; 1580pp; English.

The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are dearived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microcorganisms e.g. algae, archaeal, bacterial, fungal and parasites, for universal detection and for specific and ubsquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of at least one antimicrobial agent resistance gene or at least one toxin gene. hexA nucleic acids are used for the specific and ubjquitous detection and for identification of Streptococcus pneumoniae.

(I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group or proveness or server and account or proveness or genus or family or phylum or group or proveness. Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Nelsseria gonorrhoeae and Staphylococcus sp., Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention. Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp.,

strain expressing the marker gene is separated by using the marker gene of the transformant as the index. Genes relating to amino acid biosynthesis can be easily isolated by using the mutant. The present sequence is a 0.3 kb PCR fragment contgy, the recA gene from Brevibacterium flavus strain MJ-233. A recA gene-deleted mutant strain was prepd. for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A plasmid which cannot be replicated autonomously in a Coryneform bacterium carries a DNA region having at least one inverted repeat (IR) present upstream or downstream of an open reading frame within inserted sequence. The IRs are derived from the 5' upstream and 3' downstream regions of a marker gene derived from the Coryneform bacterium. The plasmid is used in a method for obtaining a mutant in which a Coryneform bacterium is transformed with the plasmid and the

The present invention describes a method for generally a repertory of nucleic acids of tut, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasitical species, genus, family and group. A nucleic and ubquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (1) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one artimicrobial agent resistance gene or at east one design at the antimicrobial agent resistance gene or at east one design at the angular and sample and for the ubiquitous detection and for identification of Streptococcus pneumoniae.

C. I can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificitly tests as results can be determined in an hour and improved accuracy is also achieved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for generating a repertory of

Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

Claim 26; Page 1105; 1580pp; English.

uncleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microcranisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (1) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at detection of at least one antimicrobial agent resistance gene or at upiquitous detection and for identification of Streptococcus pneumoniae.

(1) can be used to design a therapeutic agent which is effective against micrographisms. Microbial species or genus or family or phylum or group which can be detected include Ablotrophia adiacens, Bordetella Sp., Corynebacteriaceae family, Pseudomonads group, Streptococcus sp., Andered to and detection and determined group, Streptococcus sp., Andered to and determined group and all or and all determined group and all or and determined group and all or and determined group and determined group. Neisseria gonorrhoeae and Staphylococcus sp.. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention. The present invention describes a method for generating a repertory of
